

# Week 10 - Predictive modeling

L10-07. [Information] Searchlight analysis

**Soo Ahn Lee**

Ph.D. student

30 April 2021

## Searchlight analysis (Kriegeskorte et al., 2006, PNAS)

“Where in the brain does the *activity pattern* (instead of spatially averaged activity) contain information about the experimental condition?” (→ where does the local activity pattern change?)

1. The “searchlight” is centered on each voxel in turn
2. Compute a multivariate effect statistic
3. Resulting map shows how well the multivariate signal in the local spherical neighborhood differentiates the experimental conditions

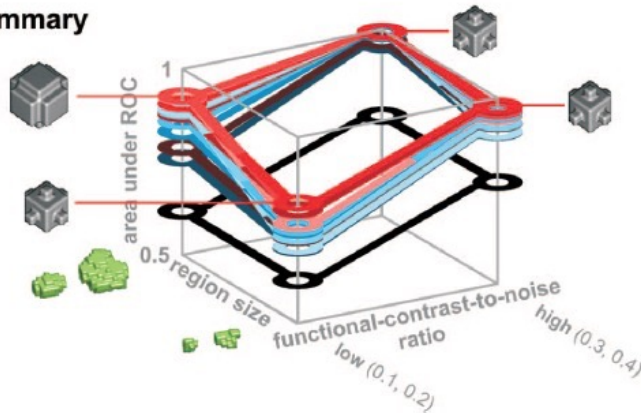

The activity pattern is replicable and can be estimated as the average across trials within each condition

## Searchlight analysis (Kriegeskorte et al., 2006, PNAS)

Simulated fMRI data

Summary

Color coding of mapping techniques

Best performance:  
4-mm radius size

Real fMRI data

Voxel sets and their intersection
